## FES110 Electric Deadlock Strike - High Security Installation Instructions

## Introduction

The FESI1O series dead - lock electric door strike release mechanism has been designed to provide door access control while maximising security to a door assembly fitted with square bolt deadlocks.

The FESl10 monitors both door lock tongue and internal locking of the strike. The device is supplied Power to Lock (PTL) or Power to Open (PTO) and cannot be changed, and operates in $12-30 \mathrm{VDC}$ multi-voltage mode. Product comes with a 2 year warranty. The device is manufactured in FSH's Sydney operation

## Features

Installed into the door frame, the FESl10 operates in conjunction with a mechanical high security deadlock. The dead bolt of the mechanical door lock is captured by the strike keeper when locked and is held securely until the strike receives an access or release signal from the access control system. The keeper than swivels out and remains in this position until the door is closed and the mechanical dead bolt re-engages with the keeper, pushing it back into the locked position.

Monitoring functions include strike keeper status -DSS- (deadlock engaged) and lock status sensor -LSS- (strike securely locked).
Product now includes a multi-voltage power saving circuit board.

## Technical Data

## Power Saving Feature

The FESIIO - 12-30V now includes a multi-voltage circuit board which eliminates the requirement to order a specific voltage.

The board also features a "power saving" feature which reduces the current consumption. In fail safe mode current required to lock the door (i.e. operate the solenoid) is 600 mA reducing to 220 mA 12VDC. Current loads at 24VDC are 350 mA and 120 mA . In fail secure mode the current required to open the door (i.e. operate the solenoid) is 600 mA reducing to 220 mA 12 VDC . Current loads at 24 VDC are 350 mA and 120 mA . In both cases the current drops once the solenoid operates(Faile safe locked/Fail secure unlocked).

## Dimensions

## Wiring Diagram

Standard wiring. Contacts are N.C. with door closed and secure.

Wiring using bolt sensing. Solenoid will only power when the door is closed (PTL fail safe only)
